- (54) Title: METHOD OF TREATMENT FOR LUNG DISEASES USING ANTISENSE OLIGONUCLEOTIDES
- (57) Abstract

A method of treating airway disease in a subject in need of such treatment is disclosed. The method comprises topically administering to the subject an antisense oligonucleotide in an amount effective to treat the ariway disease, where the antisense oligonucleotide is essentially free of adenosine. Pharmaceutical formulations are also disclosed.

# METHOD OF TREATMENT FOR LUNG DISEASES USING ANTISENSE OLIGONUCLEOTIDES

This invention was made with Government support under grant ROICA47217-06 from the National Cancer Institute. The Government has certain rights to this invention.

## Field of the Invention

5

This application concerns a method of administering antisense oligonucleotides essentially free of adenosine as a treatment for lung diseases.

## Background of the Invention

Antisense oligonucleotides have 10 considerable theoretical consideration as potentially useful pharmacologic agents in human disease. R. Wagner, 333-335 (1994). However, practical 372, applications of these molecules in actual models of human 15 disease have been elusive. One important consideration in the pharmacologic application of these molecules is route of administration. Most experiments utilizing antisense oligonucleotides in vivo have involved direct application to limited regions of the brain (see C. 20 Wahlestedt, Trends in Pharmacological Sciences 15, 42-46 (1994); J. Lai et al., Neuroreport 5, 1049-1052 (1994); K. Standifer et al., Neuron 12, 805-810 (1994); Akabayashi et al., Brain Research 21, 55-61 (1994)), or to spinal fluid (see e.g. L. Tseng et al., European J. 25 Pharmacol. 258, R1-3 (1994); R. Raffa et al., European J. Pharmacol. 258, R5-7 (1994); F. Gillardon et al., (1994)). Neurosci. 6, 880-884 J. applications have limited clinical utility due to their invasive nature.

-2-

systemic administration of antisense . The oligonucleotides also poses significant problems with respect to pharmacologic application, not the least of which is the difficulty in targeting disease-involved 5 tissues. In contrast, the lung is an excellent potential target for antisense oligonucleotide application since it may be approached noninvasively and in a tissue-specific manner. Additionally, the lung represents an exceptional target for antisense ODN therapeutics ascompared to other 10 in vivo target organs or tissues, possibly because the lung is lined with surfactant which consists primarily of cationic lipids, well known to enhance cellular uptake of ODNs in other systems. However, the technology involved in delivering antisense agents to the lung remains relatively undeveloped, and potential problems related to 15 the application of antisense agents to the lung remain unexplored.

Adenosine, a purine which contributes intermediary metabolism participates and the 20 regulation of physiological activity, is a recognized neuromodulator. This nucleoside is involved in many local regulatory mechanisms, in particular at synapses in the CNS and at neuroeffector junctions in the periphery. In the CNS adenosine is known to inhibit the release of a variety of neurotransmitters (noradrenaline, serotonin, 25 GABA, acetylcholine, dopamine, glutamate, etc.), inhibit neurotransmission, depress neuronal firing, induce spinal analgesia, and to possess anxiolytic properties (E.S. Ben-Soreket al., Archives of Internal 30 Medicine 153, 2701-2702 (1993)). In the heart, adenosine is known to slow atrioventricular (AV) conduction, suppress pacemaker activity, possess antiarrhythmic effects, modulate autonomic control, and to trigger the synthesis and release of prostaglandins. M.K. Church et J. Allergy & Clinical Immunology 92, 190-194 35 It also possesses potent vasodilatory effects and modulates vascular tone. S.T. Holgate et al., Annals

of the New York Academy of Sciences 629, 227-236 (1991).

As a therapeutic agent, adenosine has achieved considerable recent success as an antiarryhthmic agent in 5 the treatment of supraventricular tachycardia. DeGroff and M.J. Silka, Journal of Pediatrics 125, 822-823 (1994); I. Drake et al., Human and Exp. Toxicol. 13, However, many adverse effects of 263-265 (1994). adenosine treatment have been reported in the literature. 10 See, e.g., A. Aggarwal, et al., Anesthesiology 79, 1132-1135 (1993); K.K. Burkhart, American J. Emergency Med. 11. 249-250 (1993); S.K. Srinivasan and P.J. Iversen, J. Clin. Lab. Analysis 9, 129-137 (1995); C.A. Stein et al., Pharmacology & Therapeutics 52, 365-384 (1991); B.B. 15 Fredholm et al., Pharmacological Reviews 46, 143-156 (1994); H. Saito, et al., Blood 66, 1233-1240 (1985). asthmatic individuals show an particular, sensitivity to adenosine and adenosine monophosphate. See, J.H. Butterfield et al., Leukemia Res. 12, 345-355 (1988); CLONETICS: Normal Human Cell Systems Manual 20 (1995); R.W. Wagner, Nature 372, 333-335 near-fatal induction of bronchospasm occurred in asthmatic individuals administered adenosine for supraventricular tachycardia. See, S. Tabor, in: 25 Current Protocols in Molecular Biology, Vol. 1, Section 3.10.2 (John Wiley & Sons, 1987); J.H. Weiss, Id., at Section 6.2.2.

Similarly, asthmatic rabbits produced using the dust mite allergic rabbit model of human asthma also were shown to respond to aerosolized adenosine with marked bronchoconstriction, while non asthmatic rabbits showed no response. S. Ali et al., Agents Actions 37, 165-176 (1992). Recent work using this model system has suggested that adenosine-induced bronchoconstriction and bronchial hyperresponsiveness in asthma are mediated primarily through the stimulation of adenosine receptors. S. Ali et

-4-

PCT/US96/09306

al., J. Pharmacol. Exp. Ther. 268, 1328-1334 (1994); S. Ali et al., Am. J. Physiol 266, L271-277 (1994).

Accordingly, adenosine is contraindicated in the lungs of asthmatics (who represent 10% of the adult and 15% of the pediatric population in the United States). Since antisense ODNs are typically composed of all four base pairs, adenine, guanine, cytosine and thymidine, their breakdown products will produce free deoxyadenosine monophosphate in these hyperresponsive airways. Deoxyadenosine monophosphate differs from adenosine monophosphate only by the loss of an oxygen atom on the 3' carbon of the sugar moiety.

#### Summary of the Invention

A first aspect of the present invention is a method of treating airway disease in a subject in need of such treatment. The method comprises administering an antisense oligonucleotide essentially free of adenosine to the lungs of the subject in an amount effective to treat the airway disease.

A second aspect of the present invention is a pharmaceutical composition, comprising, together in a pharmaceutically acceptable carrier, an antisense oligonucleotide essentially free of adenosine in an amount effective to treat an airway disease.

A third aspect of the present invention is the use of an antisense oligonucleotide essentially free of adenosine as given above for the preparation of a medicament for treating airway disease in a subject in need of such treatment.

25

30

### Brief Description of the Drawings

Figures 1-4 demonstrate that antisense oligonucleotides can be utilized as effective agents in the treatment or prevention of airway diseases.

Figure 1 illustrates the effects of  $A_1$  adenosine receptor antisense oligonucleotides and mismatch control

-5-

antisense oligonucleotides on the dynamic compliance of the bronchial airway in a rabbit model. Figure 2 illustrates the specificity of A<sub>1</sub> adenosine receptor antisense oligonucleotides as indicated by the A<sub>1</sub> and A<sub>2</sub> 5 adenosine receptor number present in A<sub>1</sub> adenosine receptor antisense oligonucleotide-treated airway tissue.

Figure 3 is a graphical representation illustrating that aerosolized deoxyadenosine monophosphate is a potent bronchoconstrictor in asthmatic pathways of allergic rabbits. Further, the figure shows that the effect of deoxyadenosine monophosphate is equipotent to that observed for adenosine monphosphate.

Figure 4 is a graphical representation illustrating that bronchoconstrictor effects occur with aerosolized phosphorothicate oligodeoxynucleotides containing adenosine, but not with oligodeoxynucleotides that are free of adenosine.

### Detailed Description of the Invention

Nucleotide sequences are presented herein by single strand only, in the 5' to 3' direction, from left to right. Nucleotides and amino acids are represented herein in the manner recommended by the IUPAC-IUB Biochemical Nomenclature Commission, or (for amino acids) by three letter code, in accordance with 37 CFR §1.822 and established usage. See, e.g., PatentIn User Manual, 99-102 (Nov. 1990) (U.S. Patent and Trademark Office, Office of the Assistant Commissioner for Patents, Washington, D.C. 20231); U.S. Patent No. 4,871,670 to Hudson et al. at Col. 3-lines 20-43 (applicants specifically intend that the disclosure of this and all other patent references cited herein be incorporated herein by reference).

The method of the present invention may be used to treat airway disease in a subject for any reason, with the intention that adenosine content of antisense compounds be eliminated or reduced so as to prevent its

-6-

PCT/US96/09306

liberation upon antisense degredation. Such liberation may cause serious, even life-threatening, bronchoconstriction in patients with hyperreactive airways. Examples of airway diseases that may be treated by the method of the present invention include cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis, and other airway diseases characterized by an inflammatory response.

Antisense oligonucleotides to the  $A_1$  and  $A_3$ 10 receptors are shown to be effective in the downregulation of  $A_1$  or  $A_3$  in the cell. One novel feature of this treatment, as compared to traditional treatments for adenosine-induced bronchoconstriction, administration is direct to the lungs. Additionally, a 15 receptor protein itself is reduced in amount, rather than merely interacting with a drug, and toxicity is reduced. Other proteins that may be targeted with antisense agents for the treatment of lung conditions include, but are not limited to: human A2a adenosine receptor, human A2b 20 adenosine receptor, human IgE receptor  $\beta$ , human Fcepsilon receptor CD23 antigen, human histidine decarboxylase, human beta tryptase, human tryptase-I, human prostaglandin D synthase, human cyclooxygenase-2, human eosinophil cationic protein, human eosinophil derived neurotoxin, human eosinophil peroxidase, human 25 adhesion intercellular molecule-1 (ICAM-1), human vascular cell adhesion molecule 1 (VCAM-1), human endothelial leukocyte adhesion molecule (ELAM-1), human P selectin, human endothelial monocyte activating factor, human IL-3, human IL-4, human IL-5, human IL-6, human IL-8, human monocyte-derived neutrophil chemotactic factor, human neutrophil elastase, human neutrophil oxidase factor, human cathepsin G, human defensin 1, human defensin 3, human macrophage inflammatory protein-1alpha, human muscarinic acetylcholine receptor HM1, human 35 muscarinic acetylcholine receptor HM3, human fibronectin, human GM-CSF, human tumor necrosis factor  $\alpha$ , human

-7-

PCT/US96/09306

leukotriene C4 synthase, human major basic protein, and human endothelin 1. In these latter targets, and in target genes in general, it is particularly imperative to eliminate or reduce the adenosine content of the corresponding antisense oligonucleotide to prevent their breakdown products from liberating adenosine.

As used herein, the term "treat" or "treating" a lung disease refers to a treatment which decreases the likelihood that the subject administered such treatment will manifest symptoms of the lung disease. The term "downregulate" refers to inducing a decrease in production, secretion or availability (and thus a decrease in concentration) of the targeted intracellular protein.

The present invention is concerned primarily with the treatment of human subjects but may also be employed for the treatment of other mammalian subjects, such as dogs and cats, for veterinary purposes. Targeted proteins are preferably mammalian and more preferably of the same species as the subject being treated.

In general, "antisense" refers to the use of small, synthetic oligonucleotides, resembling singlestranded DNA, to inhibit gene expression by inhibiting function of the target messenger RNA 25 Milligan, J.F. et al., J. Med. Chem. 36(14), 1923-1937 In the present invention, inhibition of gene expression of the  $A_1$  or  $A_3$  adenosine receptor is desired. Gene expression is inhibited through hybridization to coding (sense) sequences in a specific messenger RNA (mRNA) target by hydrogen bonding according to Watson-The mechanism of antisense Crick base pairing rules. exogenously inhibition is that the oligonucleotides decrease the mRNA or protein levels of the target gene or cause changes in the growth 35 characteristics or shapes of the cells. Id. See also Helene, C. and Toulme, J., Biochim. Biophys. Acta 1049, 99-125 (1990); Cohen, J.S., Ed., Oligodeoxynucleotides as

Antisense Inhibitors of Gene Expression; CRC Press:Boca Raton, FL (1987).

As used herein, "antisense oligonucleotide" is defined as a short sequence of synthetic nucleotides that

(1) hybridizes to any coding sequence in an mRNA which codes for the targeted protein, according to hybridization conditions described below, and (2) upon hybridization causes a decrease in gene expression of the targeted protein.

10 The mRNA sequence of the  $A_1$  or  $A_3$  adenosine receptor is derived from the DNA base sequence of the gene expressing either the A1 or A3 adenosine receptor. The sequence of the genomic human A1 adenosine receptor is known and is disclosed in U.S. Patent No. 5,320,963 to G. Stiles et al. The A3 adenosine receptor has been cloned, sequenced and expressed in rat (see F. Zhou et al., Proc. Nat'l Acad. Sci. USA 89:7432 (1992)) and human (see M.A. Jacobson et al., U.K. Patent Application No. 9304582.1 (1993)). Thus, antisense oligonucleotides downregulate the production of the  $A_1$  or  $A_3$  adenosine 20 receptor may be produced in accordance with standard techniques.

One aspect of this invention is an antisense oligonucleotide having a sequence capable of binding specifically with any sequence of an mRNA molecule which encodes an airway disease-associated protein so as to prevent translation of the mRNA molecule.

Chemical analogs of oligonucleotides (e.g., oligonucleotides in which the phosphodiester bonds have been modified, e.g., to the methylphosphonate, the phosphotriester, the phosphorothioate, the phosphorodithioate, or the phosphoramidate, so as to render the oligonucleotide more stable in vivo) are also an aspect of the present invention. The naturally occurring phosphodiester linkages in oligonucleotides are susceptible to degradation by endogenously occurring cellular nucleases, while many analogous linkages are

highly resistant to nuclease degradation. See Milligan et al., and Cohen, J.S., supra. Protection from degradation can be achieved by use of a "3'-end cap" strategy by which nuclease-resistant linkages are 5 substituted for phosphodiester linkages at the 3' end of the oligonucleotide. See Tidd, D.M. and Warenius, H.M., Br. J. Cancer 60, 343-350 (1989); Shaw, J.P. et al., Nucleic Acids Res. 19, 747-750 (1991). Phosphoramidates, phosphorothicates, and methylphosphonate linkages all function adequately in this manner. More extensive 10 modification of the phosphodiester backbone has been shown to impart stability and may allow for enhanced increased cellular permeation affinity and oligonucleotides. See Milligan, et al., supra. Many different chemical strategies have been employed to replace the entire phosphodiester backbone with novel Backbone analogues Id. linkages. phosphorothicate, phosphorodithicate, methylphosphonate, boranophosphate, phosphotriester, phosphoramidate, 5'-thioformacetal, 3'-thioformacetal, 20 formacetal, thioether, carbonate, 5'-N-carbamate, sulfate, sulfonate, sulfamate, sulfonamide, sulfone, sulfite, sulfoxide, sulfide, hydroxylamine, methylene(methylimino) (MMI) or methyleneoxy(methylimino) (MOMI) linkages. and methylphosphonate-modified 25 Phosphorothioate oligonucleotides are particularly preferred due to their availability through automated oligonucleotide synthesis. Where appropriate, the antisense oligonucleotides may be administered in the form of their pharmaceutically 30 acceptable salts.

Antisense oligonucleotides may be of any suitable length (e.g., from about 10 to 60 nucleotides in length), depending on the particular target being bound and the mode of delivery thereof. Preferably the antisense oligonucleotide is directed to an mRNA region containing a junction between intron and exon. Where the antisense oligonucleotide is directed to an intron/exon

-10-

PCT/US96/09306

junction, it may either entirely overlie the junction or may be sufficiently close to the junction to inhibit splicing out of the intervening exon during processing of precursor mRNA to mature mRNA (e.g., with the 3' or 5' terminus of the antisense oligonucleotide being is positioned within about, for example, 10, 5, 3, or 2 nucleotides of the intron/exon junction).

When practicing the present invention, the antisense nucleotides administered may be related in origin to the species to which it is administered. When treating humans, human antisense may be used if desired.

Pharmaceutical compositions comprising antisense oligonucleotide as given above effective to reduce expression of an A, or A, adenosine receptor by 15 passing through a cell membrane and binding specifically with mRNA encoding an A<sub>1</sub> or A<sub>3</sub> adenosine receptor in the cell so as to prevent its translation are another aspect of the present invention. Such compositions are provided in a suitable pharmaceutically acceptable carrier (e.g., 20 sterile pyrogen-free saline solution). The antisense oligonucleotides may be formulated with a hydrophobic carrier capable of passing through a cell membrane (e.g., in a liposome, with the liposomes carried in a pharmaceutically acceptable aqueous carrier). The oligonucleotides may also be coupled to a substance which mRNA, such as a ribozyme. inactivates oligonucleotides may be administered to a subject to inhibit the activation of A1 or A3 adenosine receptors, which subject is in need of such treatment for any of the herein. 30 reasons discussed Furthermore, pharmaceutical formulation may also contain chimeric molecules comprising antisense oligonucleotides attached to molecules which are known to be internalized by cells. These oligonucleotide conjugates utilize cellular uptake increase cellular concentrations pathways to 35 Examples of macromolecules used in oligonucleotides. this manner include transferrin, asialoglycoprotein

-11-

PCT/US96/09306

(bound to oligonucleotides via polylysine) and streptavidin.

In the pharmaceutical formulation the antisense compound may be contained within a lipid particle or 5 vesicle, such as a liposome or microcrystal. particles may be of any suitable structure, such as unilamellar or plurilamellar, so long as the antisense oligonucleotide is contained therein. Positively charged N-[1-(2,3-dioleoyloxi)propyl]-N,N,Nsuch as 10 trimethyl-ammoniumethylsulfate, "DOTAP," or particularly preferred for such particles and vesicles. The preparation of such lipid particles is well known. See, e.g., U.S. Patent Nos. 4,880,635 to Janoff et al.; 4,906,477 to Kurono et al.; 4,911,928 to Wallach; 15 4,917,951 to Wallach; 4,920,016 to Allen et al.;4,921,757 to Wheatley et al.; etc.

Subjects may be administered the active composition by any means which transports the antisense nucleotide composition to the lung. The antisense compounds disclosed herein may be administered to the lungs of a patient by any suitable means, but are preferably administered by generating an aerosol comprised of respirable particles, the respirable particles comprised of the antisense compound, which particles the subject inhales. The respirable particles may be liquid or solid. The particles may optionally contain other therapeutic ingredients.

Particles comprised of antisense compound for practicing the present invention should include particles of respirable size: that is, particles of a size sufficiently small to pass through the mouth and larynx upon inhalation and into the bronchi and alveoli of the lungs. In general, particles ranging from about .5 to 10 microns in size are respirable. Particles of non-respirable size which are included in the aerosol tend to deposit in the throat and be swallowed, and the quantity of non-respirable particles in the aerosol is preferably

minimized. For masal administration, a particle size in the range of 10-500  $\mu m$  is preferred to ensure retention in the masal cavity.

Liquid pharmaceutical compositions of active compound for producing an aerosol can be prepared by combining the antisense compound with a suitable vehicle, such as sterile pyrogen free water. Other therapeutic compounds may optionally be included.

Solid particulate compositions containing respirable dry particles of micronized antisense compound may be prepared by grinding dry antisense compound with a mortar and pestle, and then passing the micronized composition through a 400 mesh screen to break up or separate out large agglomerates. A solid particulate composition comprised of the antisense compound may 15 optionally contain a dispersant which facilitate the formation of an aerosol. A suitable dispersant is lactose, which may be blended with the antisense compound in any suitable ratio (e.g., a 1 to 1 20 ratio by weight). Again, other therapeutic compounds may also be included.

The dosage of the antisense compound administered will depend upon the disease being treated, the condition of the subject, the particular formulation, 25 the route of administration, the timing of administration ·a subject, etc. In general, intracellular concentrations of the oligonucleotide of from .05 to 50  $\mu$ M, or more particularly .2 to 5  $\mu$ M, are desired. administration to a subject such as a human, a dosage of from about .01, .1, or 1 mg/Kg up to 50, 100, or 150 mg/Kg or more is typically employed. Depending on the solubility of the particular formulation of active compound administered, the daily dose may be divided unit dose administrations. among one or several 35 Administration of the antisense compounds may be carried out therapeutically (i.e., as a rescue treatment) or prophylactically.

20

-13-

PCT/US96/09306

Aerosols of liquid particles comprising the antisense compound may be produced by any suitable means, such as with a nebulizer. See, e.g., U.S. Patent No. 4,501,729. Nebulizers are commercially available devices 5 which transform solutions or suspensions of the active ingredient into a therapeutic aerosol mist either by means of acceleration of a compressed gas, typically air or oxygen, through a narrow venturi orifice or by means of ultrasonic agitation. Suitable formulations for use 10 in nebulizers consist of the active ingredient in a liquid carrier, the active ingredient comprising up to 40% w/w of the formulation, but preferably less than 20% w/w. the carrier is typically water or a dilute aqueous alcoholic solution, preferably made isotonic with body 15 fluids by the addition of, for example, sodium chloride. include preservatives additives Optional formulation is not prepared sterile, for example, methyl hydroxybenzoate, antioxidants, flavoring agents, volatile oils, buffering agents and surfactants.

Aerosols of solid particles comprising the active compound may likewise be produced with any solid particulate medicament aerosol generator. Aerosol administering solid particulate generators for medicaments to a subject produce particles which are 25 respirable, as explained above, and generate a volume of aerosol containing a predetermined metered dose of a medicament at a rate suitable for human administration. One illustrative type of solid particulate aerosol generator is an insufflator. Suitable formulations for 30 administration by insufflation include finely comminuted powders which may be delivered by means of an insufflator or taken into the nasal cavity in the manner of a snuff. In the insufflator, the powder (e.g., a metered dose thereof effective to carry out the treatments described 35 herein) is contained in capsules or cartridges, typically made of gelatin or plastic, which are either pierced or opened in situ and the powder delivered by air drawn

-14-

through the device upon inhalation or by means of a manually-operated pump. The powder employed in the insufflator consists either solely of the active ingredient or of a powder blend comprising the active ingredient, a suitable powder diluent, such as lactose, and an optional surfactant. The active ingredient typically comprises from 0.1 to 100 w/w of formulation. A second type of illustrative aerosol generator comprises a metered dose inhaler. Metered dose inhalers are pressurized aerosol dispensers, typically 10 containing a suspension or solution formulation of the active ingredient in a liquified propellant. During use these devices discharge the formulation through a valve adapted to deliver a metered volume, typically from 10 to 15 150  $\mu$ l, to produce a fine particle spray containing the active ingredient. Suitable propellants include certain chlorofluorocarbon compounds, for example, dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane and mixtures thereof. formulation may additionally contain one or more co-20 solvents, for example, ethanol, surfactants, such as oleic acid or sorbitan trioleate, antioxidants and suitable flavoring agents.

The aerosol, whether formed from solid or liquid particles, may be produced by the aerosol generator at a rate of from about 10 to 150 liters per minute, more preferably from about 30 to 150 liters per minute, and most preferably about 60 liters per minute. Aerosols containing greater amounts of medicament may be administered more rapidly.

The following examples are provided to illustrate the present invention, and should not be construed as limiting thereon. In these examples,  $\mu M$  means micromolar, mL means milliliters,  $\mu M$  means micrometers, mm means millimeters, cm means centimeters, °C means degrees Celsius,  $\mu M$  means micrograms, mg means

milligrams, g means grams, kg means kilograms, M means molar, and h means hours.

#### EXAMPLE 1

#### Design and synthesis of antisense oligonucleotides

5

25

design of antisense oligonucleotides against the A1 and A3 adenosine receptors may require the solution of the complex secondary structure of the target A, receptor mRNA and the target A, receptor mRNA. After generating this structure, antisense nucleotides are 10 designed which target regions of mRNA which might be construed to confer functional activity or stability to the mRNA and which optimally may overlap the initiation Other target sites are readily usable. demonstration of specificity of the antisense effect, 15 other oligonucleotides not totally complementary to the but containing identical nucleotide mRNA, compositions on a w/w basis, are included as controls in antisense experiments.

Adenosine A1 receptor mRNA secondary structure 20 was analyzed and used as described above to design a oligonucleotide. The phosphorothioate antisense antisense oligonucleotide which was synthesized was designated HAdAlAS and had the following sequence:

## 5'-GAT GGA GGG CGG CAT GGC GGG-3' (SEQ ID NO:1)

As a control, a mismatched phosphorothicate antisense nucleotide designated HAdA1MM was synthesized with the following sequence:

## 5'-GTA GCA GGC GGG GAT GGG GGC-3' (SEQ ID NO:2)

Each oligonucleotide had identical base content and 30 general sequence structure. Homology searches in GENBANK (release 85.0) and EMBL (release 40.0) indicated that the antisense oligonucleotide was specific for the human and rabbit adenosine  $A_1$  receptor genes, and that

-16-

mismatched control was not a candidate for hybridization with any known gene sequence.

Adenosine A<sub>3</sub> receptor mRNA secondary structure was similarly analyzed and used as described above to design two phosphorothicate antisense oligonucleotides. The first antisense oligonucleotide (HAdA3AS1) synthesized had the following sequence:

5'-GTT GTT GGG CAT CTT GCC-3' (SEQ ID NO:3)

As a control, a mismatched phosphorothioate antisense 10 oligonucleotide (HAdA3MM1) was synthesized, having the following sequence:

5'-GTA CTT GCG GAT CTA GGC-3' (SEQ ID NO:4)

A second phosphorothicate antisense oligonucleotide (HAdA3AS2) was also designed and 15 synthesized, having the following sequence:

5'-GTG GGC CTA GCT CTC GCC-3' (SEQ ID NO:5)

Its control oligonucleotide (HAdA3MM2) had the sequence:

5'-GTC GGG GTA CCT GTC GGC-3' (SEQ ID NO:6)

Phosphorothioate oligonucleotides were 20 synthesized on an Applied Biosystems Model 396 Oligonucleotide Synthesizer, and purified using NENSORB chromatography (DuPont, MD).

#### EXAMPLE 2

Testing of Al-Adenosine Receptor

Antisense Oligonucleotides in vitro

25

The antisense oligonucleotide against the human A, receptor (SEQ ID NO:1) described above was tested for

-17-

efficacy in an *in vitro* model utilizing lung adenocarcinoma cells HTB-54. HTB-54 lung adenocarcinoma cells were demonstrated to express the A<sub>1</sub> adenosine receptor using standard northern blotting procedures and 5 receptor probes designed and synthesized in the laboratory.

HTB-54 human lung adenocarcinoma cells (106/100 mm tissue culture dish) were exposed to 5.0  $\mu M$  HAdAlAS or HAdalMM for 24 hours, with a fresh change of media and 10 oligonucleotides after 12 hours of incubation. Following 24 hour exposure to the oligonucleotides, cells were harvested and their RNA extracted by standard procedures. A 21-mer probe corresponding to the region of mRNA targeted by the antisense (and therefore having the same 15 sequence as the antisense, but not phosphorothioated) was synthesized and used to probe northern blots of RNA prepared from HAdAlAS-treated, HAdAlMM-treated and nontreated HTB-54 cells. These blots showed clearly that HAdalAS but not HAdalMM effectively reduced human 20 adenosine receptor mRNA by >50%. This result showed that HAdalaS is a good candidate for an anti-asthma drug since it depletes intracellular mRNA for the adenosine A1 receptor, which is involved in asthma.

#### EXAMPLE 3

## Efficacy of A<sub>1</sub>-Adenosine Receptor Antisense Oligonucleotides in vivo

25

A fortuitous homology between the rabbit and human DNA sequences within the adenosine A<sub>1</sub> gene overlapping the initiation codon permitted the use of the phosphorothicate antisense oligonucleotides initially designed for use against the human adenosine A<sub>1</sub> receptor in a rabbit model.

Neonatal New Zealand white Pasteurella-free rabbits were immunized intraperitoneally within 24 hours of birth with 312 antigen units/mL house dustmite (D. farinae) extract (Berkeley Biologicals, Berkeley, CA),

-18-

mixed with 10% kaolin. Immunizations were repeated weekly for the first month and then biweekly for the next 2 months. At 3-4 months of age, eight sensitized rabbits were anesthetized and relaxed with a mixture of ketamine 5 hydrochloride (44 mg/kg) and acepromazine maleate (0.4 mg/kg) administered intramuscularly.

The rabbits were then laid supine comfortable position on a small molded, padded animal board and intubated with a 4.0-mm intratracheal tube (Mallinkrodt, Inc., Glens Falls, NY). 10 A polyethylene catheter of external diameter 2.4 mm with an attached latex balloon was passed into the esophagus maintained at the same distance (approximately 16 cm) the mouth throughout the experiments. intratracheal tube was attached to a heated Fleisch 15 pneumotachograph (size 00; DOM Medical, Richmond, VA), and flow was measured using a Validyne differential pressure transducer (Model DP-45161927; Validyne Engineering Corp., Northridge, CA) driven by a Gould 20 carrier amplifier (Model 11-4113; Gould Electronic, Cleveland, OH). The esophageal balloon was attached to one side of the differential pressure transducer, and the outflow of the intratracheal tube was connected to the opposite side of the pressure transducer to allow transpulmonary pressure. 25 recording of Flow integrated to give a continuous tidal volume, measurements of total lung resistance (RL) and dynamic compliance (Cdyn) were calculated at isovolumetric and flow zero points, respectively, using an automated 30 respiratory analyzer (Model 6; Buxco, Sharon, CT).

Animals were randomized and on Day 1 pretreatment values for PC50 were obtained for aerosolized adenosine. Antisense (HAdA1AS) or mismatched control (HAdA1MM) oligonucleotides were dissolved in sterile physiological saline at a concentration of 5000 ug (5 mg) per 1.0 ml. Animals were subsequently administered the aerosolized antisense or mismatch

-19-

PCT/US96/09306

oligonucleotide via the intratracheal tube (approximately 5000 μg in a volume of 1.0 ml), twice daily for two days. Aerosols of either saline, adenosine, or antisense or mismatch oligonucleotides were generated by an ultrasonic nebulizer (DeVilbiliss, Somerset, PA), producing aerosol droplets 80% of which were smaller than 5 μm in diameter.

In the first arm of the experiment, four randomly selected allergic rabbits were administered antisense oligonucleotide and four the mismatched control oligonucleotide. On the morning of the third day, PC50 values (the concentration of aerosolized adenosine in mg/ml required to reduce the dynamic compliance of the bronchial airway 50% from the baseline value) were obtained and compared to PC50 values obtained for these animals prior to exposure to oligonucleotide.

Following a 1 week interval, animals were crossed over, with those previously administered mismatch oligonucleotide now administered antisense oligonucleotide, and those previously treated with 20 antisense oligonucleotide now administered mismatch oligonucleotide. Treatment methods control measurements were identical to those employed in the first arm of the experiment. It should be noted that in six of the eight animals treated with antisense 25 oligonucleotide, adenosine-induced bronchoconstriction could not be obtained up to the limit of solubility of adenosine, 20 mg/ml. For the purpose of calculation, PC50 values for these animals were set at 20 mg/ml. values given therefore represent a minimum figure for 30 antisense effectiveness. Actual effectiveness was The results of this experiment are illustrated in both Figure 1 and Table 1.

-20~

TABLE 1. EFFECTS OF ADENOSINE A, RECEPTOR ANTISENSE OLIGONUCLEOTIDE UPON PC50 VALUES IN ASTHMATIC RABBITS.

Mismatch Control

5

A, receptor Antisense oligonucleotide

Pre	Post	Pre	Post
oligonucleotide	oligonucleotide	oligonucleotide	oligonucleotide
3.56 ± 1.02	5.16 ± 1.93	2.36 ± 0.68	>19.5 ± 0.34**

Results are presented as the mean  $(N = 8) \pm SEM$ . Significance was determined by repeated-measures analysis of variance (ANOVA), and Tukey's protected t test. \*\*Significantly different from all other groups, P < 0.01.

In both arms of the experiment, animals receiving the antisense oligonucleotide showed an order of magnitude increase in the dose of aerosolized adenosine required to reduce dynamic compliance of the lung by 50%. No effect of the mismatched control oligonucleotide upon PC50 values was observed. No toxicity was observed in any animal receiving either antisense or control inhaled oligonucleotide.

These results show clearly that the lung has exceptional potential as a target for antisense oligonucleotide-based therapeutic intervention in lung 20 They further show, in a model system which disease. closely resembles human asthma, that downregulation of the adenosine A, receptor largely eliminates adenosineinduced bronchoconstriction asthmatic in Bronchial hyperresponsiveness in the allergic rabbit model of human asthma is an excellent endpoint for antisense intervention since the tissues involved in this response lie near to the point of contact with aerosolized oligonucleotides, and the model closely 30 simulates an important human disease.

-21-

#### EXAMPLE 4

## Specificity of A<sub>1</sub>-adenosine receptor

#### Antisense oligonucleotide

At the conclusion of the crossover experiment of Example 3, airway muscle from all rabbits was quantitatively analyzed for adenosine A<sub>1</sub> receptor number. As a control for the specificity of the antisense oligonucleotide, adenosine A<sub>2</sub> receptors, which should not have been affected, were also quantified.

Airway smooth muscle tissue was dissected from 10 each rabbit and a membrane fraction prepared according to described methods (J. Kleinstein and H. Glossmann, Naunyn-Schmiedeberg's Arch. Pharmacol. 305, (1978), with slight modifications. Crude plasma membrane 15 preparations were stored at - 70°C until the time of assay. Protein content was determined by the method of Bradford, Anal. Biochem. 72, 240-254 Bradford (M. (1976)). Frozen plasma membranes were thawed at room temperature and were incubated with 0.2 U/ml adenosine 20 deaminase for 30 minutes at 37°C to remove endogenous The binding of [3H] DPCPX (A, receptoradenosine. specific) or [3H]CGS-21680 (A2 receptor-specific) was measured as previously described. S. Ali et al., J. Pharmacol. Exp. Ther. 268, 1328-1334 (1994); S. Ali et 25 al., Am. J. Physiol 266, L271-277 (1994).

As illustrated in both Figure 2 and Table 2, with adenosine A<sub>1</sub> treated animals oligonucleotide in the crossover experiment had a nearly 75% decrease in  $A_i$  receptor number compared to controls, 30 as assayed by specific binding of the  $A_1$ -specific There was no change in adenosine  ${\tt A}_2$ antagonist DPCPX. receptor number, as assayed by specific binding of the  $\mbox{A}_2$ 2-[p-(2-carboxyethyl)agonist receptor-specific phenethylamino]-5'-(N-ethylcarboxamido) adenosine (CGS-35 21680).

Results are presented as the mean  $(N = 8) \pm SEM$ . Significance was determined by repeated-measures analysis of variance (ANOVA), and Tukey's protected t test. \*\*Significantly different from mismatch control, P < 0.01.

The above demonstrates the effectiveness of antisense oligonucleotides in treating airway diseases. Since the antisense oligonucleotides described above eliminate the receptor systems responsible for adenosine-mediated bronchoconstriction, it may be less imperative to eliminate adenosine from them. However, it would be preferable to eliminate adenosine from even these oligonucleotides. Examples of such adenosine-free oligonucleotides are provided below in Example 5.

#### EXAMPLE 5

The method of the present invention is also practiced with the following antisense oligonucleotides targeted to their corresponding proteins, in essentially the same manner as given above, for the treatment of various conditions in the lungs. Described below is a series of antisense oligonucleotides targetting the mRNA of proteins involved in inflammation. Adenosine has been eliminated from their nucleotide content to prevent its liberation during degradation.

In the following, the first sequence provided

after the name of the targeted inflammation-involved

protein is the antisense sequence that targets the
initiation codon, wherein the naturally-occurring
adenosine is substituted by one of the following: (1) a
universal base that is not adenosine; (2) a adenosine

analog that lacks the ability to bind to the adenosine A1

PCT/US96/09306

-23-

and/or A3 receptors; or (3) a "spacer." Any one of these three is represented in the sequence as the letter "B," recognized by the IUPAC-IUB Nomenclature Commission as "not-A." See Patentin User Manual, p.99 (November 1990).

5 Listed following the antisense sequence targeted against the initation codon are additional antisense oligonucleotide sequences directed against other portions of the mRNA of the targeted protein. These additional sequences are the "des-adenosine antisense sequences," in that they do not contain adenosine within the sequence.

Fragments of the following sequences that are at least ten, and more preferably at least twelve, nucleotides in length are also an aspect of the presnet invention and are useful in carrying out the present invention. Fragments set forth below that span multiple lines of test indicate "5'-" at the beginning thereof, and "-3'" at the end thereof.

	Human maje	or basic protein:

GTTTCATCTT GGCTTTATCC (SEQ ID NO:44)

40 EXAMPLE 6

Turning now to Figure 3, two asthmatic rabbits were adminstered adenosine, and two rabbits were adminstered dAMP, at the indicated concentrations, by inhalation as described above in Example 3. The results (shown in Figure 3 as change in compliance) indicate that dAMP, a breakdown product of antisense

-44-

oligodeoxynucleotides containing adenosine, is as potent in the induction of bronchoconstriction as adenosine in the hyperresponsive airways of asthmatic rabbits.

#### EXAMPLE 7

5 An aerosolized phosphorothioate antisense ODN consisting of 50% adenosine and 50% quanine plus cytosine in a random configuation was found to produce potent bronchoconstrictor effects in hyperreactive airways of asthmatic rabbits, 10 illustrated in Figure 4. The control molecule used in this study, a phosphorothicate 21-mer antisense ODN consisting of 50% guanine and 50% thymidine plus cytosine (des-adenosine ODN) produced no bronchoconstrictor or any other effect in these same animals.

In this study, bronchoconstrictor effects were measured as a percentage change in bronchial compliance. Each group consisted of two allergic rabbits, and data shown are for the period following the second of two daily administrations of 5 mg aerosolized ODN by nebulizer.

These results indicate that antisense oligonucleotides, even when modified to slow degradation, produce adenosine metabolites capable of potent bronchoconstriction when adminstered in asthmatic 25 airways.

The foregoing examples are illustrative of the present invention, and are not to be construed as limiting thereof. The invention is defined by the following claims, with equivalents of the claims to be included therein.

PCT/US96/09306 WO 96/40162

## THAT WHICH IS CLAIMED IS:

1. A method of treating airway disease in a subject in need of such treatment, comprising:

topically administering an antisense oligonucleotide to the airway epithelium of said subject in an amount effective to treat said disease;

said antisense oligonucleotide being essentially free of adenosine.

- A method according to claim 1 wherein said airway disease is a lung disease and said airway
   epithelium is a lung airway epithelium.
  - 3. A method according to claim 1 wherein said antisense oligonucleotide comprises nucleotides in which at least one phosphodiester linkage is replaced with a linkage selected from the group consisting of methylphosphonate linkages, phosphorotiester linkages, phosphorothicate linkages, and phosphoramidate linkages.
- 4. A method according to claim 1 wherein said airway disease is selected from the group consisting of cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis, and other airway diseases characterized by an inflammatory response.
- 5. A method according to claim 1 wherein said antisense oligonucleotide is targeted against an mRNA 25 encoding a protein selected from the group consisting of human A2a adenosine receptor, human A2b adenosine receptor, human IgE receptor  $\beta$ , human Fc-epsilon receptor CD23 antigen, human histidine decarboxylase, human beta human tryptase-I, human prostaglandin D tryptase, 30 synthase, human cyclooxygenase-2, human eosinophil cationic protein, human eosinophil derived neurotoxin, human eosinophil peroxidase, human intercellular adhesion

-61-

molecule-1 (ICAM-1), human vascular cell molecule 1 (VCAM-1), human endothelial leukocyte adhesion molecule (ELAM-1), human P selectin, human endothelial monocyte activating factor, human IL-3, human IL-4, human 5 IL-5, human IL-6, human IL-8, human monocyte-derived neutrophil chemotactic factor, human neutrophil elastase, human neutrophil oxidase factor, human cathepsin G, human human defensin 3, human macrophage defensin 1, protein-1-alpha, human muscarinic inflammatory receptor HM1, human muscarinic 10 acetylcholine acetylcholine receptor HM3, human fibronectin, human GM-CSF, human tumor necrosis factor \alpha, human leukotriene C4 synthase, human major basic protein, and endothelin 1.

- 6. A method according to claim 1 wherein said 15 antisense oligonucleotide is delivered by administering an aerosol of respirable particles containing said antisense oligonucleotide to the lungs of said subject.
- A method according to claim 6, wherein said particles are selected from the group consisting of
   solid particles and liquid particles.
  - 8. A method according to claim 6, wherein said aerosol is comprised of particles having a particle size within the range of about 0.5 to 10 microns.
- A method according to claim 8 wherein said
   particles are liposomes containing said antisense oligonucleotide.
- 10. A method according to claim 6 wherein said antisense oligonucleotide is administered in amount sufficient to achieve intracellular concentrations of said antisense oligonucleotide in said subject from about 0.1 to 10  $\mu$ M.

WO 96/40162

-62-

PCT/US96/09306

11. A pharmaceutical composition, comprising, together in a pharmaceutically acceptable carrier:

an antisense oligonucleotide in an amount effective to treat an airway disease;

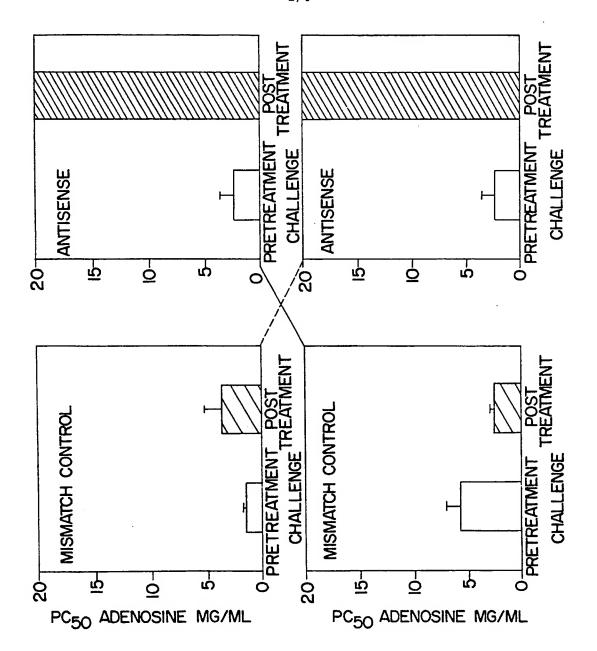

- 5 said antisense oligonucleotide being essentially free of adenosine.
  - 12. A pharmaceutical composition according to claim 11 wherein said airway disease is a lung disease and said airway epithelium is a lung airway epithelium.
- 13. A pharmaceutical composition according to claim 11 wherein said antisense oligonucleotide comprises nucleotides in which at least one phosphodiester linkage is replaced with a linkage selected from the group consisting of methylphosphonate linkages, phosphorotiester linkages, phosphorothioate linkages, phosphorodithioate linkages, and phosphoramidate linkages.
  - 14. A pharmaceutical composition according to claim 11 wherein said airway disease is cystic fibrosis.
- A pharmaceutical composition according to 15. 20 claim 11 wherein said antisense oligonucleotide is targeted against an mRNA encoding a protein selected from the group consisting of human A2a adenosine receptor, human A2b adenosine receptor, human IgE receptor  $\beta$ , human Fc-epsilon receptor CD23 antigen, human histidine 25 decarboxylase, human beta tryptase, human tryptase-I, human prostaglandin D synthase, human cyclooxygenase-2, human eosinophil cationic protein, human eosinophil derived neurotoxin, human eosinophil peroxidase, human intercellular adhesion molecule-1 (ICAM-1), human 30 vascular cell adhesion molecule 1 (VCAM-1), human endothelial leukocyte adhesion molecule (ELAM-1), human P selectin, human endothelial monocyte activating factor, human IL-3, human IL-4, human IL-5, human IL-6, human IL-

PCT/US96/09306

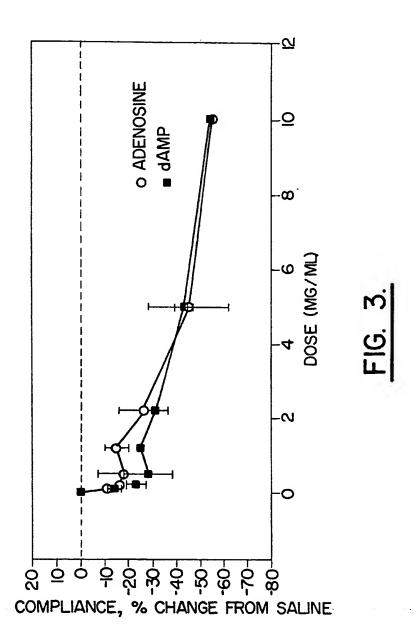

- 8, human monocyte-derived neutrophil chemotactic factor, human neutrophil elastase, human neutrophil oxidase factor, human cathepsin G, human defensin 1, human defensin 3, human macrophage inflammatory protein-1-alpha, human muscarinic acetylcholine receptor HM1, human muscarinic acetylcholine receptor HM3, human fibronectin, human GM-CSF, human tumor necrosis factor α, human leukotriene C4 synthase, and human major basic protein.
- 16. A pharmaceutical composition according to 10 claim 11 wherein said antisense oligonucleotide is delivered by administering an aerosol of respirable particles containing said antisense oligonucleotide to the lungs of said subject.
- 17. A pharmaceutical composition according to claim 16, wherein said particles are selected from the group consisting of solid particles and liquid particles.
- 18. A pharmaceutical composition according to claim 16, wherein said aerosol is comprised of particles having a particle size within the range of about 0.5 to 20 10 microns.
  - 19. A pharmaceutical composition according to claim 16 wherein said particles are liposomes containing said antisense oligonucleotide.
- 20. A pharmaceutical composition according to claim 11 wherein said antisense oligonucleotide is administered in amount sufficient to achieve intracellular concentrations of said antisense oligonucleotide in said subject from about 0.1 to 10  $\mu$ M.
- 21. A pharmaceutical composition according to 30 claim 11, wherein said antisense oligonucleotide is conjugated to a molecule capable of cellular uptake.
